

claude-mem Skills Reference

Quick reference for all 10 skill commands provided by the claude-mem plugin

/do

Name: do

Description: Execute a phased implementation plan using subagents. Use when asked to execute, run, or carry out a plan — especially one created by make-plan.

/how-it-works

Name: how-it-works

Description: Explain how claude-mem captures observations, when memory injection kicks in, and where data lives. Use when asked "how does claude-mem work?".

/knowledge-agent

Name: knowledge-agent

Description: Build and query AI-powered knowledge bases from claude-mem observations. Use when you want focused "brains" from observation history or to compile expertise on specific topics.

/learn-codebase

Name: learn-codebase

Description: Prime a codebase by reading every source file in full. Use when starting a new or unfamiliar project, or when asked to "learn the codebase" or "get up to speed".

/make-plan

Name: make-plan

Description: Create a detailed, phased implementation plan with documentation discovery. Use when asked to plan a feature, task, or multi-step implementation — especially before executing with do.

/mem-search

Name: mem-search

Description: Search claude-mem's persistent cross-session memory database. Use when asked "did we already solve this?" or "how did we do X last time?".

/pathfinder

Name: pathfinder

Description: Map a codebase into feature-grouped flowcharts, identify duplicated concerns across features, and propose a unified architecture. Use before a major refactor.

/smart-explore

Name: smart-explore

Description: Token-optimized structural code search using tree-sitter AST parsing. Use instead of reading full files when you need to understand code structure or find functions.

/timeline-report

Name: timeline-report

Description: Generate a "Journey Into [Project]" narrative report analyzing a project's entire development history. Use when asked for a timeline report or development journey.

/version-bump

Name: version-bump

Description: Automated semantic versioning and release workflow for Claude Code plugins. Handles version bumps across manifests, npm publishing, build verification, git tagging, and changelog generation.
